

Everest is producing the Multi wash machines all in house with 2, 3, 4, 5 or more tanks also to request of customers special machines are produced. Mainly working on customer requests and special machines we also have our standard range which contains prewash, ultrasonic cleaning, rinsing, passivation and drying, two or more are used in a combination. The stages of cleaning processes are as following;

Pre-Wash

This process is for prewashing of very dirty and greasy parts before precise ultrasonic cleaning to get rid of rough contamination to save time, energy, water and cleaning chemical consumption.

Ultrasonic Cleaning

This is the process which the cleaning is done completely. Ultrasonic power is the energy changing electric power to sound waves. With ultrasonic power we reach the points where it's very difficult to clean, like small holes and complicated parts which can't be cleaned with brush or hand.

Rinsing

After cleaning process cleaning chemicals residuals remain on the surface of the parts. To clean parts from chemical residuals we use rinsing either by closed circulation system or continue fresh water supply.

Passivation

If the cleaned parts are wanted to be protected against rust/oxidation; this process is by adding passivation chemical into the tank to passivate the parts.

Drying

After the cleaning process the parts are dried by hot air or vacuum at this stage according to customer requirements and parts shapes.

Options

Oil Skimmer, Circulation, Filtration, Air Blast, Carrier system, Pneumatic lid, are the optional parts to be added on request.

Application Areas

Multi stage wash machines are used generally in Plating industry, Automotive industry, Medical industry, Textile industry, Metal Goods, Electronic, and a lot of other sectors where precise cleaning is an essential request.
